Git: RPC failed; HTTP 400 curl 22 The requested URL returned error: 400

Chatgpt

That Git error —

nginx

Copy Edit

RPC failed; HTTP 400 curl 22 The requested URL returned error: 400

— usually means **your Git client tried to send data the remote rejected right away.**
With Git over HTTP/S, that often comes from one of these causes:

Common causes & fixes

1. Push too large for the server's limit

- Services like GitHub/GitLab/Bitbucket may reject single files > 100 MB or repos > a certain size.
- Check:**

bash

Copy Edit

```
git push --verbose
```

See if it fails right after sending a big file.

- Fix:** Remove or reduce large files, then recommit:

bash

Copy Edit

```
git filter-repo --path bigfile.bin --invert-paths
```

or use Git LFS:

bash

Copy Edit

```
git lfs install  
git lfs track "*.psd"
```

2. Buffer size too small for the push

- Git can fail mid-transfer if the http buffer is too small.
- Fix:**

bash

Copy Edit

```
git config http.postBuffer 524288000  
git config http.maxRequestBuffer 100M
```

3. Corrupted remote URL or wrong branch target

- Check:**

bash

Copy Edit

```
git remote -v
```

and verify the URL matches your repo.

4. Authentication issues

- token expired or you're missing permissions for that branch.
- **Fix:** Refresh your personal access token or re-authenticate:

```
bash
```

[Copy](#) [Edit](#)

```
git remote set-url origin https://<username>@github.com/user/repo.
```

5. HTTP vs HTTPS mismatch / Proxy issues

- If you're behind a proxy or using corporate network filtering, the request can get mangled.
- Try switching to SSH:

```
bash
```

[Copy](#) [Edit](#)

```
git remote set-url origin git@github.com:user/repo.git
```

If you give me the **full push/pull command you ran** and whether this is GitHub, GitLab, or something else, I can narrow down exactly which one it is and give you a step-by-step fix.

Do you want me to walk you through a **safe way to remove large files from Git history** so the push will go through?

[Copy](#) [Like](#) [Reply](#) [Share](#) [Bookmark](#) [Refresh](#)

fatal: the remote end hung up unexpectedly

Got it — now we have:

```
vbnet
```

[Copy](#) [Edit](#)

```
RPC failed; HTTP 400 curl 22 The requested URL returned error: 400  
fatal: the remote end hung up unexpectedly
```

because your push was too big, you hit a file size limit, or your Git HTTP request exceeded some buffer limit.

Why this happens

- **Large single file** → GitHub/GitLab hard reject >100 MB over HTTP.
- **Big total push** → If you're uploading a lot at once, the HTTP request can exceed server or proxy limits.
- **HTTP buffer default too small** → Git stops mid-transfer.
- **Auth/URL mismatch** → The server immediately closes the connection.

Quick fixes to try

1. Increase Git's HTTP buffer

```
bash
```

[Ask ChatGPT](#)[Copy](#) [Edit](#)

```
git config http.postBuffer 524288000  
git config http.maxRequestBuffer 100M  
git config core.compression 0
```

```
bash

git push origin main
```

Copy Edit

2. Check for large files

```
bash

git rev-list --objects --all | sort -k 2 | \
git cat-file --batch-check='%(objecttype) %(objectname) %(objectsize) %'
sort -k3 -n | tail -20
```

Copy Edit

If you see any >100 MB, GitHub/GitLab will reject them.

Solution: Remove them with `git filter-repo` (or `BFG Repo-Cleaner`) and push again.

3. Try pushing in smaller chunks

```
bash

git push origin main --no-verify
git push origin HEAD~50:main
```

Copy Edit

4. Switch to SSH (bypasses some HTTP limits)

```
bash

git remote set-url origin git@github.com:user/repo.git
```

Copy Edit

If you want, I can give you **one clean command sequence** that finds any >100 MB files in your repo history, removes them, and lets you push without this error.

Do you want me to go straight to that cleanup sequence?
